

Dear M.Sc Physics students,

Warm welcome to the III Batch of M.Sc students in Physics!

This e-brochure is now updated and contains practical information of the masters' programme in a simple and systematic manner with all required information. The Physics programme with its core-specialization structure offers a wide variety of possibilities, enabling you to pursue your particular ambitions and interests in this fascinating area of science. Courses at different levels of specialization will enable you to deepen your physics knowledge and find out how it is applied in modern research and development.

There are various electives and few courses are on nanosciences and materials science, which are interdisciplinary and has immense applications in all sectors of life. It is at par from the existing syllabi of other universities and NIT's.

Our Laboratories are well- equipped with state of art instruments (including Scanning Electron Microscope) and efforts to make them the best in the region. The laboratories once completely established in all respects shall be made open to the interested students of the country, where they can carry their summer/winter internships also.

We are convinced that we have created a rewarding and challenging post graduate programme in Physics for the first time in the History of NIT Srinagar that keeps its promise which will prepare you for the future. The academic loss if any due to prevailing conditions in Kashmir can be compensated with extra classes. We are less in number but nevertheless academically sound galaxy of eminent faculty having specializations in thrust areas are always available to our students.

We wish you a good start and lots of success!

Dr. M.A.Shah

National Institute of Technology Srinagar
Jammu and Kashmir

July 2017

National Institute of Technology Srinagar: A Brief Profile

The National Institute of Technology, Srinagar (NIT), one of the leading institutes in north of the country, was established in 1960. In 2004, it had the unique distinction of becoming an Institute of National Importance under the NIT Act under the auspices of Ministry of Human Resources Development, Govt. of India.

Being fully residential, the campus located on the western bank of the Dal Lake near the famous Hazratbal Shrine, provides comfortable accommodation to all faculty and students. The institute has signed Memorandum of Understanding (MOU) with various national and international academies, professional and research institutes as well as industry to augment the learning process. These ties are a means for our students to gain valuable and relevant knowledge and experience, providing them with the building blocks for a successful future career. Students from all over the country epitomize a healthy amalgamation of different cultures, religions and languages on the campus and present a classical example of a mini cultural India.

The prestigious technical institute has ten departments which cater six postgraduate and ten undergraduate programmes besides offering Ph.D. degree in all Engineering and Science disciplines. Since its inception, the **Department of Physics** is offering the General Physics courses Physics I and Physics II for all branches of B.Tech. students during first and second semesters respectively. In addition, the department offers several electives to various branches. The Department has full-fledged laboratories for research and offers Ph.D./M.Phil. programmes in Solid state physics, Materials science, Nanotechnology, Nuclear physics, Space physics, and in renewable energy sectors. Presently, the department has six faculty members and the faculty has developed research collaborations with several premier institutions across the globe. In order to inculcate the academic culture, the department regularly organizes lecture/quiz competitions and invited talks by the eminent scientists. So far the department has produced maximum M.Phil. and Ph.D. scholars in the Institutes. Unending efforts are being made by the department to develop the well equipped research laboratories to cater the needs of master's programme which is likely to be approved. In this programme, we have offered intrinsically challenging and didactically inspiring courses.

Small but academically sound galaxy of eminent faculty having specializations in thrust areas are actively engaged in research and other academic assignments including teaching to B.Tech students. Dozens of students pursuing Ph.D under their guidance have collaborations with reputed laboratories across the globe. The faculty has always brought laurels to the institute. However, the Institute overall has witnessed a remarkable growth in all sectors under the guidance of our Director Prof. Rajat Gupta, from the last three years and perseverance of the coordinator Dr. Shah M A.

Programme Structure:

Entire two years Masters Programme has been divided into four semesters. In first year (two semesters) all the core courses have been introduced with more information with relevant updated topics with a view to link earlier (B.Sc) programme. In second year, courses have been designed to accommodate more applied subjects (electives) and comprehensive project work in industry or any national laboratory of repute.

Total No of seats:

Twenty five (25)

Reservation for open, SC/ST, OBC and PH are as per Govt. of India rules.

Eligibility Criteria:

Students for admission to M.Sc. Programme must satisfy the criteria:

Bachelor's degree with at least 60% marks/6.5 CGPA (on 10 point scale) or equivalent, with **Physics** as main and **Mathematics** as a subsidiary subject **OR** with **Physics and Mathematics** among the main subjects. 5% or 0.5 in CGPA on a 10 point scale relaxation may be extended to candidates belonging to SC/ST/OBC/PH candidates.

Admission Procedure:

Interested candidates satisfying the eligibility criteria will have to submit their application form in the prescribed format, which will be made available on the institute web page (www.nitsri.net). Applicant should be a citizen of India. Admission of foreign nationals, if any, shall be governed by the rules stipulated by the Government of India from time to time. Two step processes to admit the students into M.Sc. programme shall be carried as:

- (i) Short listing of candidates as per eligibility.
- (ii) Performance in written test examination.

The examination pattern (Theory as well as Practical) approved by the senate will be followed for the programme.

Entrance will be conducted by Institute.

Course Monitoring and Course Evaluation

- Academic coordinator for each semester should be notified by the National Institute of Technology/Institution/Dean much before the start of the semester course work.
- Two independent sets of question papers for the end semester examination should be got set by the academic coordinators for all the courses in each semester. This action should be taken by the academic coordinators much before the start of the semester course work.
- The question paper shall be uniformly distributed over the syllabus giving equal weightage to all the units. The students have to do five questions selecting at least one from each unit. However, all the procedures of the institute shall be followed for the course evaluation.

PROGRAMME AT A GLANCE

Name of Degree	Name of Programme	Intake (Full-time)	Year of starting proposed	Duration	Name of Degree & Eligibility for Admission
M.Sc.	APPLIED PHYSICS	25	2014	2 years	Bachelor's degree in Science and Engineering with at least 60% marks/6.5 CGPA (on 10 point scale) or equivalent, with Physics as main and Mathematics as a subsidiary subject OR with Physics and Mathematics among the main subjects. For SC/ST candidates 55% marks or CGPA 5.5/10 in aggregate in the qualifying examination.

Course Structure

The Credit structure is as follows:

Core: 56

Electives: 04

Projects: 30

Total Credits: 90

PROGRAMME STRUCTURE

SEMESTER - I

Total Credits: 90

S. No.	Course Code	Courses	L	T	P/	Credits	Page No.

Vector Analysis in Curved Coordinates and Tensors, Orthogonal Coordinates in R^3 , Differential Vector Operators, Special Coordinate Systems, Circular Cylinder Coordinates, Spherical and Polar Coordinates.

Tensor Analysis, Contraction, Direct Product, Quotient Rule, Pseudotensors, Dual Tensors, General Tensors, Tensor Derivative Operators. Group Theory, Introduction, Generators of Continuous Group, Orbital Angular Momentum, Angular Momentum Coupling, Homogeneous Lorentz Group, Discrete Groups

Matrices, Cayley-Hamilton Theorem, Eigenvalues and eigenvectors. Functions of a Complex Variable, Analytic Properties, Cauchy-Riemann Conditions, Cauchy's Integral Theorem, Cauchy's Integral Formula, Taylor series, Laurent Expansion, Singularities, Mapping, Functions of a Complex Variable, Calculus of Residues and evaluation of integrals.

Applications and Properties of Fourier Series, Discrete Fourier Transform, Fourier Expansions of Mathieu Functions, Development of the Fourier Integral, Inversion Theorem, Fourier Transform of Derivatives, Convolution Theorem, Momentum Representation

First-Order Differential Equations, Separation of Variables, Singular Points, Series Solutions—Frobenius Method, A Second Solution, Non-homogeneous Equations Eigenfunction Expansion Bessel Functions, Bessel Functions of the First Kind, Orthogonality, Neumann Functions, Modified Bessel Functions, Legendre Generating Function, Recurrence Relations, Orthogonality, Associated Legendre Functions, Spherical Harmonics, Orbital Angular Momentum Operator, Addition Theorem for Spherical Harmonics, Legendre Functions of the Second Kind, Hermite Functions, Laguerre Functions,

3. E. Kreyszig, Advanced Engineering Mathematics, 8th edition, John Wiley & Sons Inc. (1999).
4. W.W Bell: Special functions for scientists and engineers.
5. J. Mathews and R L Walker: Mathematical Methods of Physics.

Newtonian mechanics and its limitations. Constrained motion. Constraints and their classification. Principle of virtual work. D' Alembert's principle. Generalized coordinates. Deduction of Lagrange's equations from D' Alembert's Principle. Generalized momenta and energy. Cyclic or ignorable coordinates. Rayleigh's dissipation function. Integrals of motion. Symmetries of space and time with conservation laws.

Rotating frames. Inertial Forces. Electromagnetic analogy of inertial forces. Terrestrial and astronomical applications of Coriolis force. Foucault's pendulum. Problems.

Central force. Definition and properties of central force. Two-body central force problem. Stability of orbits. Conditions for closure. General analysis of orbits. Kepler's laws. Kepler's equation. Artificial satellites. Rutherford scattering.

Principle of least action. Hamilton's principle. The calculus of variations. Derivation of Hamilton's equations of motion for holonomic systems from Hamilton's principle. Hamilton's principle and characteristic functions.

Canonical Transformations, Generating functions. Poisson brackets, Poisson's Theorem. Invariance of PB under canonical transformations, Angular momentum PBs. Hamilton-Jacobi equation. Connection with Classical Mechanics canonical transformation. Problems. Small oscillations, Normal modes and coordinates. Problems.

2. L.D. Landau and E.M. Lifshitz, Mechanics, Butterworth-Heinemann (1976).
3. W. Greiner, Classical Mechanics - Point particles and Relativity, Springer-Verlag (1989).
4. N.C Rana and P.S Joag, Classical Mechanics.
5. John R Taylor, Classical Mechanics, University Science Books 2012

Basic postulates of quantum mechanics. Linear operators Hermitian operators. Orthogonality of Eigen functions of a Hermitian operator. Completeness of Eigen functions. Commuting operators and their Eigen functions. Dirac's bra and ket notation. Representation of operators as matrices. Change of basis. Unitary transformation and its significance. Equations of motion. Schrodinger picture and Heisenberg picture. Interpretation of the wave function. Schwartz Inequality and Uncertainty Principle. Classical limit of the Schrodinger equation. operator methods in Q Mechanics, Double Stern-Gerlach experiment for spin half system.

Generalized orbital angular momentum. Operators for J , Spin angular momentum. Total angular momentum operator. The Eigenvalues of L and S . Pauli spin matrices. Commutation relations. Eigen values and Eigen functions of Pauli matrices. Spin functions for two spin - 1/2 particles. Addition of angular momenta. Clebsch Gordan Coefficients. Physical meaning of identity. Symmetric and anti-symmetric wave functions. Construction from unsymmetrized functions. The Pauli Exclusion Principle.

Time independent perturbation theory. Perturbation of non-degenerate states. First order perturbation. Second order perturbation. Perturbation of an oscillator. Perturbation of degenerate states. Removal of degeneracy. First order Stark effect in hydrogen atom. Time dependent perturbation theory. Transition probability. The variation method with simple applications. Green's functions incoming and outgoing solutions.

LABORATORIES Ist SEM

PSPHY LB1

SOLID STATE PHYSICS LAB

C L T P

2 0 0 4

1. To determine the band gap of given semiconductor crystal using four probe method.
2. To determine the Hall coefficient for given semiconductor and study its field dependence.
3. Study of frequency dependence of dielectric constant for a given sample.
4. To study hysteresis of ferromagnetic material.
5. To Study the Thermo luminescence of F-Centers in Alkali Halides Crystals.
6. To study the morphology of a sample using SEM and to study elemental analysis by EDX method.
7. To measure the frequency dependence of dielectric constant of a ferroelectric material (BaTiO₃) using an 'Impedance meter'.
8. Measurement of resistivity of very low to highly resistive samples by four probe method at different temperatures.
9. To study the superconducting transition of YBCO superconductor.
10. Measurement of Magneto-resistance of Semiconductors.

PSPHY LB2

ADVANCED OPTICS LAB

C L T P

2 0 0 4

1. Determination of line width of a laser using monochromator.
2. Diffraction of light due to a straight edge
3. Thickness of the enamel coating on a wire - by diffraction.
4. Production and analysis of linearly, circularly and elliptically polarized light
5. Measurement of screw parameters using a laser beam.
6. Using Michelson's interferometer for the determination of thickness of film and its refractive index.
7. Measurement of coherence length of laser using Michelson interferometer.
8. Construction and reconstruction of an object using holography.
9. Diffraction of light by straight edge.
10. Mach-Zehnder Interferometer using a He-Ne laser.

Coulomb's Law, Electric Field, Gauss's Law, Differential Form of Gauss's Law, Surface Distributions of Charges and Dipoles and Discontinuities in the Electric Field and Potential, Poisson and Laplace Equations, Green's Theorem, Uniqueness of the Solution with Dirichlet or Neumann Boundary Conditions, Formal Solution of Electrostatic Boundary-Value Problem with Green Function, Electrostatic Potential Energy and Energy Density

Faraday's Law, Quasi-Static Fields, Introduction and Definitions, Biot and Savart Law, Differential Equations of Magnetostatics and Ampere's Law, Vector Potential, Vector Potential and Magnetic Induction for a Circular Current Loop, Magnetic Fields of a Localized Current Distribution, Magnetic Moment, Force and Torque on and Energy of a Localized Current Distribution in an External Magnetic Induction, Macroscopic Equations, Boundary Conditions on B and H, Methods of Solving Boundary-Value Problems in Magnetostatic, Uniformly Magnetized Sphere, Magnetized Sphere in an External Field, Faraday's Law of Induction, Energy in the Magnetic Field, Energy and Self- and Mutual Inductances, Eddy Currents; Magnetic Diffusion.

Method of Images, Point Charge in the Presence of a Grounded Conducting Sphere, Point Charge Near a Conducting Sphere at Fixed Potential, Laplace Equation in Rectangular Coordinates, Multipoles, Electrostatics of Macroscopic Media, Dielectrics, Multipole Expansion, Multipole Expansion of the Energy of a Charge Distribution in an External Field Boundary-Value Problems with Dielectrics, Molecular Polarizability and Electric Susceptibility, Models for Electric Polarizability, Electrostatic Energy in Dielectric Media, Macroscopic Electromagnetism, Conservation Laws, Maxwell's Displacement Current; Maxwell Equations, Vector and Scalar Potentials, Gauge Transformations, Lorenz Gauge, Coulomb Gauge, Green Functions for the Wave Equation, Retarded Solutions for the Fields: Jefimenko's Generalizations of the Coulomb and Biot-Savart Law; . Derivation of the Equations of Macroscopic Electromagnetism Poynting's Theorem and Conservation of Energy and Momentum for a System of Charged Particles and Plane Electromagnetic Waves and Wave Propagation, Plane Waves in a Nonconducting Medium, Linear and Circular Polarization, Reflection and Refraction of Electromagnetic Waves at a Plane,

LABORATORIES II SEM

PSPHY LB3

ELECTRONICS AND INSTRUMENTATION LAB

C L T P

2 0 0 4

1. To study the gain characteristics of a double stage RC coupled BJT amplifier.
2. To study the drain, transfer characteristics of a JFET.
3. To study the input and output characteristics of a differential amplifier.
4. To study MOSFET as output power amplifier.
5. Design and performance study of inverting, non-inverting and unity gain, differentiator, integrator amplifier using op-amp.
6. Design and performance study of Schmidt trigger circuit.
7. Design and performance study of astable multivibrator and mono-stable multivibrator.
8. Design and performance study of active filters (Low pass, high pass, band pass, band reject).
9. Combinational circuits: Adders, multipliers, magnitude comparators.
10. Sequential circuits: Flip flops, counters, shift registers. (Ripple counter with D type flip-flops; J-K flip flop and its application to counting).

PHY LB4

CHARACTERIZATION LAB

C L T P

2 0 0 4

1. Structural determination of powdered crystalline materials by XRD.
2. Surface morphology of the materials by SEM.
3. Characterization of semiconductors: Determination of number of charge carriers, mobility.
4. Study of Dielectric Constant and Measure Curie temperature of Ferroelectric Ceramics.
5. Apparatus for Measurement of Susceptibility of Paramagnetic Substance in the form of Solution by Quincy's Tube Method.
6. Mossbauer Spectrometer.
7. Ultrasonic testing apparatus.
8. Experimental methods for gamma-ray (G.M. Counter).
9. Determination of the g of DPPH by Electron Spin Resonance Spectrometer (ESR).
10. Determination of band gap of semiconducting materials by UV- Visible spectrometer.

Symmetry Elements, Combination of Symmetry elements (Point Groups) Concepts of point groups, Crystal Symmetry, Space groups, Symmetry and Degeneracy, Crystal field splitting, Kramers Degeneracy, Quasicrystals, General idea, approximation translational and rotational symmetry of two dimensional.

The Boltzmann transport equation, relaxation time, Electrical conductivity of metals, impurity scattering, ideal resistance, thermoelectric effects, thermal conductivity. Electronic properties in a magnetic field, Classical theory of magneto resistance, Hall effect and magnetic resistance, k space analysis of electrons motion in a uniform magnetic theory, Energy levels and density of states in a magnetic field, Quantum hall effect

The dielectric function, the dielectric function for harmonic function, Dielectric losses of electrons, K K Relations, Interaction of phonones and electrons with photons, Interband transition, Direct and indirect transition. Skin effect and anomalous skin effect.

History, general properties, measurements, critical field, temperature, current, Meissner effect, type-I and type-II superconductors (SS). London equation, penetration depth, optical properties, Cooper pair, BCS theory (Qualitative), coherence length, electron-phonon interaction, flux quantization, Josephson junction, high T_c superconductors.

Electron interaction via lattice, Cooper pairs, BCS theory, Bogoliubov transformation-notion of quasiparticles, Meissner effect Disordered in condensed matter- substitutional , positional and topographical disorder, Short and long range order, Atomic correlation function and structural description of glasses and liquids, Hubbard Model and Kondo effect.

Text Books

1. Solid State Theory: M. Sachs.
2. Principles of the theory of solids: J.M Ziman
3. Solid State Physics: Ashcroft & Mermin
4. Solid State Physics: A. J. Dekker, Macmillan, new Ed, 2011
5. Materials science and Engineering by V. Raghavan, Prentice-Hall Pvt. Ltd.

Basic nuclear properties, Nuclear size and distribution of nucleons, Energies of nucleons in the nucleus, Angular momentum, Parity and symmetry, Magnetic dipole moment and electric quadrupole moment, Energy levels and mirror nuclei. Characteristics of nuclear forces - Range and strength, Simple theory of two nucleon system-deuterons, Spin states of two nucleon system, Effect of Pauli's exclusion principle, Magnetic dipole moment and electric quadrupole moment of deuteron -The tensor forces.

Interaction of charged particles with matter. Stopping power and range. Detectors for energetic charged particles; Solid State or Semiconductor detector; Bubble chamber; Nuclear emulsions. Composite relations. E rays, Ionization and scattering measurements in nuclear emulsions, Identification of particles. Need for accelerator of charged particles, Classification of types of accelerators, Proton Synchrotron, Betatron; alternating gradient accelerator, Colliding beam accelerator.

Different types of reactions, Quantum mechanical theory, Resonance scattering, Compound nucleus formation, Statistical theory of nuclear reactions and evaporation probability.

Classification and properties of elementary particles, Leptons, Baryons, mesons particles and antiparticles excited states and resonances. Various types of interactions - gravitational, electromagnetic, weak and strong interactions and their mediating quanta, Conservation rules in fundamental interactions. Charge symmetry and charge independence, Parity and charge conjugation, Conservation of parity and its violation in different types of interactions. Strange particles, associated production, strangeness and decay modes of charged Kaons, Isospin and its conservation. Idea of eight fold way and quarks.

5. J.S Lilley: Nuclear Physics.

1. Introduction to MATLAB and its use for data analysis

- (i) MATLAB and its IDE; variables and arrays; scalar and array operations; built-in MATLAB functions;
- (ii) Working with data sets: file input/output. Data visualisation and plotting in MATLAB;
- (iii) Revision of error analysis: χ^2 analysis, errors on fitting coefficients, propagation of errors; MATLAB functions for error analysis;
- (iv) User-defined functions in MATLAB;
- (v) Comparison of MATLAB with other languages.

Project 1: Analysis of experimental spectrum data.

2. Numerical methods and the solution of ordinary differential equations

- (i) Introduction to numerical computing; errors in numerical methods;
- (ii) Numerical methods for solving ordinary differential equations; Euler's method; higher-order methods; symplectic methods;
- (iii) Implementation of numerical methods in MATLAB programs;
- (iv) The linear driven damped oscillator; phase space; conserved quantities; sources of simulation error;
- (v) Map-based schemes; introduction to nonlinear systems.

Project 2: Numerical integration of the driven damped oscillator.

3. The Monte Carlo method and its application to particle transport

- (i) Introduction to Monte Carlo methods; Monte Carlo integration; classical problems;
- (ii) Pseudorandom and quasirandom sampling; methods of generating samples with given probability density;
- (iii) Introduction to particle transport simulation; cross-sections;
- (iv) Simulation of neutron transport and scattering; nuclear criticality with Monte Carlo;
- (v) Importance sampling and statistical errors; Woodcock tracking;
- (vi) Other applications of Monte Carlo methods.

Project 3: Simulation of the penetration of neutrons through shielding.

Text books: As Suggested By Teacher

ELECTIVES

PSPHY EL 01

Renewable Sources of Energy

C L T P

4 3 1 0

Relevance of renewable energy in relation to depletion of fossil fuels and environmental considerations, Green Energy, Solar Energy, Sun as a source of energy, nature of solar radiation and sun-earth angles, Flat plate collectors, types of FPC, effects of various parameters on the performance of FPC, Overall heat loss coefficient and heat transfer correlations, collector efficiency factor, Solar thermal applications like solar cooker and solar water heaters solar driers, solar stills, solar cooling. Solar refrigeration and Carnots refrigeration cycle, thermal energy storage, active and passive heating of buildings.

Physics and Materials properties basic to photovoltaic conversion, Optical properties of solids, Direct and indirect transition semiconductors, interrelationship between absorption coefficient and band gap, recombination of carriers, Types of solar cells, pn junction solar cells, transport equation, current density, open circuit voltage and short circuit current, brief description of single crystal silicon and amorphous silicon solar cells, e.g. tandem solar cells, solid liquid junction solar cells, nature of semiconductor, electrolyte junction, photoelectrochemical solar cells

Solar Hydrogen through photoelectrolysis and photocatalytic process. Physics of material characteristics for production of solar hydrogen, Various factors relevant for safety, use of Hydrogen as fuel, use in vehicular transport, hydrogen for electricity generation, Fuel Cells, Energy Storage, Brief discussion of various storage processes, special feature of solid state hydrogen storage materials, structural and electronic characteristics of storage materials, new storage modes Wind Energy, Energy and power in Wind, Wind Turbines, Aerodynamics of Wind turbines, Environmental impacts, offshore wind energy, economics

Text Books:

1. Twidel and Weir, Renewable Energy, E& F N Spon ltd
2. Godfrey Boyle, Renewable Energy: Power for a sustainable Future, Oxford
3. Duffie, J.A. and W.A. Beckmann. Solar engineering of thermal processes, John Wiley and son's incorporation, New York.
4. Sukhatme S.P. Solar Energy, Principles of thermal collection and storage, Tata McGraw Hill Publishing Company Limited New Delhi, 1997.
5. Garg, H.P and T.C.Kandpal "Laboratory Manual on solar Thermal Experiments " Narosa publishing House , New Delhi.

Top-Down and Bottom-Up approaches of nanomaterial (nanoparticles, nanoclusters and quantum dots) synthesis: Top-down techniques: photolithography, other optical lithography (EUV, X-Ray, LIL), particle-beam lithographies (e-beam, FIB, shadow mask evaporation), probe lithographies, Bottom-up techniques: self-assembly, self-assembled monolayers, directed assembly, layer-by-layer assembly. Pattern replication techniques: soft lithography, nanoimprint lithography. Pattern transfer and enhancement techniques: dry etching, wet etching, pattern growth techniques (polymerization, directed assembly). Combination of Top-Down and Bottom-up techniques: current state-of-the-art.

Characterization Techniques Related to Nanoscience and Nanotechnology: Compositional surface analysis: XPS, SIMS, Contact angles. Microscopies: optical microscopy, fluorescence and confocal microscopy, TEM, SEM, Probe techniques: Scanning tunneling microscopy (STM), Atomic force microscopy (AFM), Scanning Nearfield Optical Microscopy SNOM, Scanning Ion Conducting Microscopy (SICM). Ellipsometry, Neutron Scattering and XRD, Spectroscopic Techniques: UV-visible, FT-IR, Raman, NMR, ESR. Electrochemical Techniques: Voltammetric techniques, AC Impedance Analysis.

Basics of nanoelectronics – Single Electron Transistor – quantum computation – tools of micro-nanofabrication – nanolithography – quantum electronic devices – MEMS and NEMS – dynamics of NEMS – limits of integrated electronics.

Text Books:

1. Jan Korvink and Andreas Greiner, Semiconductors for Micro and Nanotechnology – an Introduction for Engineers, Weinheim Cambridge: Wiley-VCH (2001).
2. M.A. Shah and T Ahmad, Principles of Nanoscience and Nanotechnology, Narosa, New Dehli
3. N John Dinardo and Weinheim Cambridge, Nanoscale Characterisation of Surfaces & Interfaces, 2nd edition, Wiley-VCH (2000).
4. M.S Rao and Singh, Nanotechnology, Wiley (2012)
5. M.A. Shah and K. A. Shah, Nanotechnology-The Science of Small, Wiley, (2013).

Klein Gordon, Dirac, Weyl and Majorana Eqns. Plane wave Solutions and observation. Non-relativistic limits of Dirac Eqn. Foldy-Wouthy transformation. Canonical quantization of neutral scalar, Charged scalar, spin 1/2 and massive spin-1 fields, Fock space and observables. Field commutation, and commutation relations.

Interaction picture. Normal product. Wick's theorem. Feynman propagator S-matrix. Feynman diagrams for QED. Quantization of electromagnetic field. Gupta-Bleuler condition. Indefinite metric. Feynman diagrams of QED. Tree level calculations of Møller-Bhabha, Compton and Scattering in external field. General Formulation. Conjugate Momentum and Quantization. Neutral Scalar Field. Commutation Relations, Normal Ordering, Bose Symmetry, Fock Space.

The Dirac Equation, Relativistic Covariance. Anti-Commutators. Quantization of the Dirac Field, Electrons and Positrons. Connection between Spin and Statistics. Discrete Symmetries, Parity, Charge Conjugation, Time Reversal, CPT Theorem. Gauge Invariance and Gauge Fixing. Quantization of the Electromagnetic Field, Propagator, Vacuum Fluctuations.

Text Books

1. Bogolubov & Shirkov : Introduction to Quantized Field Theory.
2. Bjorken & Drell : Quantum Field Theory.
3. Itzykson & Zuber : Quantum Field Theory (McGraw Hill).
4. Quantum Field Theory, C. Itzykson and J. B. Zuber, McGraw-Hill Book Co (1985).
5. Quantum Field Theory, L. H. Ryder, Cambridge University Press (2008).

Solar energy materials, luminescent and optoelectronic materials, Polymer, Liquid crystals and quasi crystals, Ceramics. Composites, Preparation of materials by different techniques: Single crystal growth, zone refining, epitaxial growth. Melt-spinning and quenching methods, sol-gel, polymer processing. Preparation of ceramic materials; Fabrication, control and growth modes of organic and inorganic thin films. different technique of thin film preparations. Basic principles
Point defect, line defect, plane defect, volume defect, dislocation, stacking faults, application, Burger vectors.

X-ray energy level schemes, diagram and non-diagram lines, Absorption of X-rays and theory of filters. X-ray scattering. General description of scattering process, coherent and incoherent scattering, total scattering from a spherically symmetric electron cloud, Quantum mechanical treatment of scattering in outline. Perfect crystal theory. Intensity form a small single crystal, Integrated intensity from a small perfect crystal (no deduction), integrated reflection from Mosaic and powder crystal.

Diffraction techniques. interpretation of x-ray powder diffraction patterns, Identification & quantitative estimation of unknown samples by X-ray powder diffraction technique and fluorescent analysis. Theory and method of particle size analysis. Integral breadth method, Warren-Averbach's Fourier method, profile fitting method, Rietveld Method.

Text Books

1. Materials science and Engineering by V. Raghavan, Prentice-Hall Pvt. Ltd.
2. Thin Solid Films by K. L Chopra.
3. Elements of X-ray diffraction by B. D. Cullity, Addison-Wesley Publishing Co.
4. Elements of crystallography by M. A. Azaroff.
5. Engineering Materials by Kenneth G. Budinski.

LABORATORIES ^{3rd} SEM

PSPHY LB 05

Computational Physics Lab V

C L T P

2 0 0 4

- 1: Programming in C and elementary graphics rendering. Solution of the one-dimensional wave equation with the leapfrog algorithm and visualization.
- 2: Elements of FORTRAN. Array constructs and operations with arrays.
- 3: Blurring of an image. Discretized Laplacian. The diffusion equation. Review of the finite and continuum Fourier transform and the fast Fourier transform (FFT).
- 4: Eigenvectors of the discretized Laplacian. Instability of the algorithm for solving the diffusion equation. Unblurring the image
- 5: Solution of the equation for the electrostatic potential in presence of conductors. Relaxation algorithms and their relation with a diffusion process. Critical slowing down. Mention of multiscale methods.
- 6: Solution of the one-dimensional time-dependent Schrödinger equation by a split operator Formalism and the FFT. Visualization of the evolution. Importance of preserving unitarity.
- 7: Generation of (pseudo)random numbers. Monte Carlo integration.
- 8: Monte Carlo simulation of the Ising model. Parallel computing and MPI (message passing interface)

PSPHY LB 06

Materials Science Laboratory

C L T P

2 0 0 4

Materials Science Special Practical Experiments:

1. To study the temperature dependence of Hall coefficient of a given semiconductor.
2. Determination of Band gap of a given semiconductor material by four probe technique.
3. Design/fabrication of a temperature controller and to study the performance of the designed controller using PID Controlled Oven.
4. Determination of Lattice parameters, particles sizes etc. of different powder samples of bulk-/nano-systems (ferrite, α -Fe₂O₃, γ -Fe₂O₃) using X-ray diffractograms.
5. Determination of Miller indices and lattice parameter of an unknown powder material by x-ray diffraction.
6. Phase identification of an unknown sample by x-ray diffraction.
7. Determination of particle size and lattice strain of an unknown powder specimen applying marq2 software and Scherrer equation.
8. Preparation of nanocrystalline powder specimen by ball milling: analysis of their x-ray spectra and particle size estimation by Scherrer formula.
9. Preparation of nanocrystalline powder specimen by chemical route: analysis of their x-ray spectra and particle size estimation by scherrer formula.
10. Study of porosity and grain size of thin film and powder sample by SEM.

Science / Scientific Writing (Theory and Practice): Goals and Objectives. Ethics in writing. Structure of documents. , importance of clear title, abstract or summary. Introduction, Methods, Results, and Discussion. Numbers and statistics, Tables and Figures, Language and grammar. Illustrations and aids. Writing proposals and instructions. Making presentations. Formatting documents. Drafts and revisions. Editing. Writing popular science / journal article,

Introduction to Philosophy of Science: What is science? Scientific reasoning; Scientific Method, Explanation in science; Realism and instrumentalism; Scientific change and scientific revolutions.

Types of research, exploratory, conclusive, modelling and algorithmic. Research process: Identification of research problems, selection of a problem, formulation of a problem. Data collection: data analysis, interpretation of results, validation of results

Intellectual Property Rights and Associated Issues: Plagiarism, paraphrasing and copy write violation. Consequences of plagiarism. Why not to fudge, tinker, fabricate or falsify data History of Patenting. Digitalizing Culture, Free Software and Free Culture. Journals and Publishers: Monopolistic practices by Academic Publishers.

Guidelines for Project in M.Sc. Course:

1. Projects would be allotted to M.Sc. (Previous) students which have to be carried out and completed all Semesters.
2. A list of projects will be finalized and announced by the Department. The students will have an option to select the project in their field of interest.
3. The project will comprise of the following:
 - a. Study of background material, Literature review *etc.*
 - b. Collection of data, procurement and fabrication of experimental Set up and writing of computer programs, if needed.
 - c. Giving a preliminary seminar before the final presentation for the purpose of internal assessment whose weight age would be 25%.
 - d. Writing a dissertation or project report. This will be submitted by the M.Sc. (Final) students.
4. The Final evaluation of the project work completed will be examined by external and internal examiners appointed by the Board of Studies on the basis of an oral presentation and the submitted Project-Report. The weight age of the final evaluation would be 75%.

Proposed plan and structure

by

Dr. M. A. Shah

Programme Coordinator
Department of Physics
